Structural and Bridge Engineers

A solid solar carport design with DSA pre-check approval

Orie² PC Carport

The Orie² Engineering PC Carport design incorporates an efficient, proven design that has already been through the time consuming and rigorous review by The Division of the State Architect (DSA). The Orie² PC Carport is not tied to a specific steel fabricator and can be competitively bid as desired.

Orie² Engineering draws from over 150 MW of experience with solar structures to create an unparalleled level of service.

Key Features

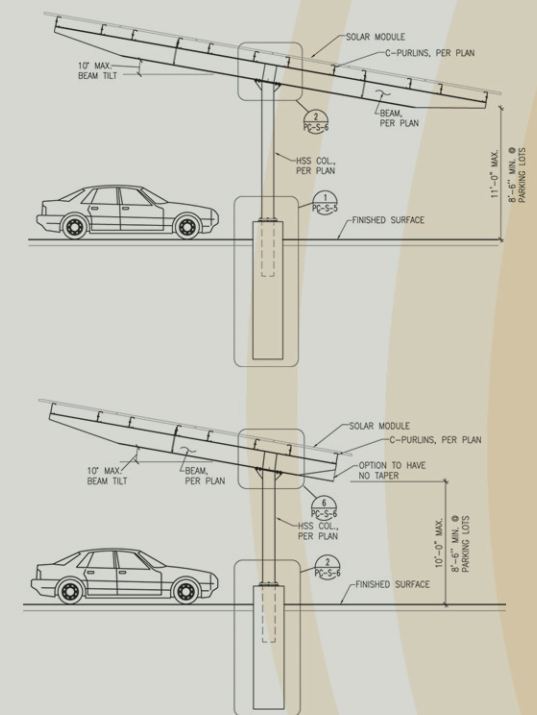

Bidable Design

The Orie² PC Carport is not tied to a specific fabricator. The carport designs have been independently designed and approved by DSA. This allows for more flexibility when considering a more traditional design, bid, build project model.

Flexible and Economical

The Orie² PC Carport was designed with the understanding that both designers and contractors will prefer to have several options when constructing the carports. The PC includes T and L options for the carport, including options for snow loading, anchor bolted bases, accommodations for conduit routing, inverter equipment pads, and fencing. Additionally, the carport features a bolted beam-column connection.
